

# CryptoSuite

Protect your documents from prying eyes

Everyday businesses are exchanging thousands of files and documents over the unsecured network. Some documents contain highly confidential information such as trade agreement, pricing information, business strategies, or even personal data. Sending unencrypted file is just like sending postcard, it can be easily read by anyone.

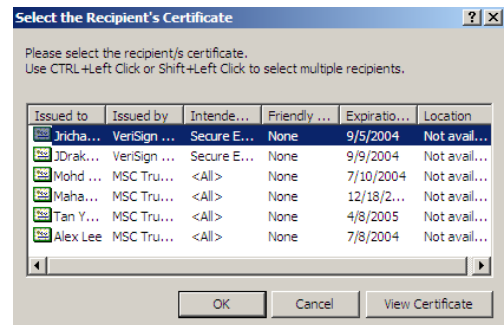

**CryptoSuite** from MSC Trustgate allows you to secure your files and documents with a single-click of the mouse button. This utility uses digital certificate to encrypt the file so that only the intended recipient can only decrypt it using their private key. The encrypted file can be safely stored in any medium or send over the less-secured web-mail.

**CryptoSuite** is easy to install and it seamlessly integrates into your Windows file system. The suite also includes other capabilities such as signing and verifying functions so that you can authenticate the sender, and ensure the integrity of the file received.

## Features & Benefits:

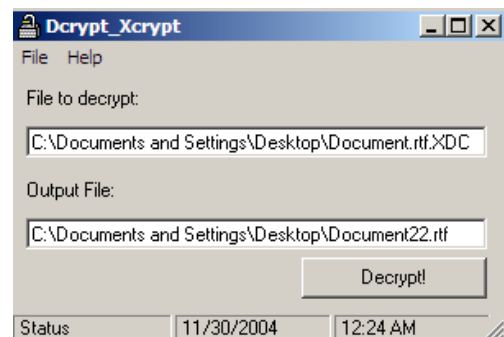

### TGEncrypt

Encrypt any confidential file and document by simply right-click on the file icon. This program uses the recipient's digital certificate to encrypt the file. Sender can select one or multiple recipients' certificates in a single operation.

### TGDcrypt

Recipient of the file uses his private key to decrypt the file. They can also rename or choose a new destination for the output file.

### TGSign

Digital signing of a document can never be easier than this. An electronic document that is digitally signed is legal binding in the courts of law.

### TGVerify

With this function, recipient can be assured that the file or document was sent by the intended sender and it has not been tampered with during transmission.
